DATA MINING TOR, SOCIAL NETWORKS, OSINT WITH AIL PROJECT

E.102

CIRCL COMPUTER INCIDENT RESPONSE CENTER LUXEMBOURG

MISP PROJECT https://www.misp-project.org/

MISP
Threat Sharing

MARCH 22, 2022

INTRODUCTION

CONCEPTS - DEEP WEB

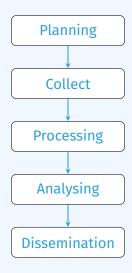

- **Deep Web** is the part of World Wide Web not indexed or directly accessible by standard web search-engines;
- This can be content hidden from **crawlers** by requiring a specific access and this can includes private social media, password-protected forums or content protected by different measures such as paywalls or specific security interface to access the information;
- A large portion of content accessible via Internet is part of the deep web¹.

¹also called invisible web, hidden web or non-indexed web

CONCEPTS - DARKNET

- **Darknet** is an overlay network running on top of Internet requiring specific software to access the network and its services;
- Tor, I2P and Freenet are the most commonly used ones. Many are used for hidden services access and some for proxy access to the Internet;
- There are **legitimate use-cases** for such network but also many **illegal or criminal usage**.

LIFECYCLE OF COLLECTION AND ANALYSIS

COLLECTING, PROCESSING AND ANALYSING CONTENT - WEB PAGES

- Building a search engine on the web is a challenging task because:
 - ► it has to crawl webpages,
 - ▶ it has to to make sense of unstructured data.
 - ► it has to **index** these data,
 - ▶ it has to provide a way to retrieve data and structure data (e.g. correlation).
- Doing so on Tor is even more challenging because:
 - services don't always want to be found.
 - parts of the dataset have to be discarded.
- in each case, it requires a lot of bandwidth, storage and computing power.

COLLECTING, PROCESSING AND ANALYSING CONTENT - STRUCTURED DATA

- Some data are structured and are easy to process:
 - metadata!
 - ► API responses.
- Some even provide cryptographic evidences:
 - authentication mechanisms between peers,
 - OpenGPG can leak a lot of metadata
 - key ids,
 - subject of email in thunderbird,
 - ► Bitcoin's Blockchain is public.
 - pivoting on these data with external sources yields interesting results.

AIL DESIGN OBJECTIVES

OBJECTIVES OF THE SESSION

- Show how to use and extend an open source tool to monitor web pages, pastes, forums and hidden services
- Explain challenges and the design of the AIL open source framework
- Review different collection mechanisms and sources
- Learn how to create new modules
- Learn how to use, install and start AIL
- Supporting investigation using the AIL framework and including it in cyber threat intelligence lifecycle

AIL FRAMEWORK

FROM A REQUIREMENT TO A SOLUTION: ALL FRAMEWORK

History:

- AIL initially started as an **internship project** (2014) to evaluate the feasibility to automate the analysis of (un)structured information to find leaks.
- In 2019, AIL framework is an **open source software** in Python. The software is actively used (and maintained) by CIRCL and many organisations.
- In 2020, AIL framework is now a complete project called **ail project**².

CAPABILITIES OVERVIEW

COMMON USAGE

- Check if mail/password/other sensitive information (terms tracked) leaked
- **Detect** reconnaissance of your infrastructure
- Search for leaks inside an archive
- Monitor and crawl websites

SUPPORT CERT/CSIRTS AND LAW ENFORCEMENT ACTIVITIES

- Proactive investigation: leaks detection
 - ► List of emails and passwords
 - ► Leaked database
 - AWS Keys
 - ► Credit-cards
 - ► PGP private keys
 - Certificate private keys
- Feed Passive DNS or any passive collection system
- CVE and PoC of vulnerabilities most used by attackers

SUPPORT CERT/CSIRTS AND LAW ENFORCEMENT ACTIVITIES

- Website monitoring
 - monitor booters
 - Detect encoded exploits (WebShell, malware encoded in Base64...)
 - ► SQL injections
- Automatic and manual submission to threat sharing and incident response platforms
 - ► MISP
 - ► TheHive
- Term/Regex/Yara monitoring for local companies/government

Sources of Leaks: Paste Monitoring

- Example: https://gist.github.com/
 - ► Easily storing and sharing text online
 - Used by programmers and legitimate users
 - → Source code & information about configurations

Sources of Leaks: Paste monitoring

- Example: https://gist.github.com/
 - Easily storing and sharing text online
 - Used by programmers and legitimate users
 - → Source code & information about configurations
- Abused by attackers to store:
 - ► List of vulnerable/compromised sites
 - ► Software vulnerabilities (e.g. exploits)
 - Database dumps
 - \rightarrow User data
 - \rightarrow Credentials
 - → Credit card details
 - ► More and more ...

WHY SO MANY LEAKS?

- Economical interests (e.g. Adversaries promoting services)
- Ransom model (e.g. To publicly pressure the victims)
- Political motives (e.g. Adversaries showing off)
- Collaboration (e.g. Criminals need to collaborate)
- Operational infrastructure (e.g. malware exfiltrating information on a pastie website)
- Mistakes and errors

ARE LEAKS FREQUENT?

Yes! and we have to deal with this as a CSIRT.

- Contacting companies or organisations who did specific accidental leaks
- Discussing with media about specific case of leaks and how to make it more practical/factual for everyone
- Evaluating the economical market for cyber criminals (e.g. DDoS booters³ or reselling personal information - reality versus media coverage)
- Analysing collateral effects of malware, software vulnerabilities or exfiltration
 - \rightarrow And it's important to detect them automatically.

PASTE MONITORING AT CIRCL: STATISTICS

- Monitored paste sites: 27
 - ► qist.qithub.com
 - ▶ ideone.com
 - **...**

	2016	2017	08.2018
Collected pastes	18,565,124	19,145,300	11,591,987
Incidents	244	266	208

Table: Pastes collected and incident⁴ raised by CIRCL
