Data mining Tor, social networks, OSINT with AIL Project

E.102

CIRCL Computer Incident Response Center Luxembourg

MISP Project
https://www.misp-project.org/
March 25, 2022 - v0.7

INTRODUCTION

- **Deep Web** is the part of World Wide Web not indexed or directly accessible by standard web search-engines;
- This can be content hidden from **crawlers** by requiring a specific access and this can includes private social media, password-protected forums or content protected by different measures such as paywalls or specific security interface to access the information;
- A large portion of content accessible via Internet is part of the deep web[1].

---

[1]also called invisible web, hidden web or non-indexed web

- **Darknet** is an overlay network running on top of Internet requiring specific software to access the network and its services;
- Tor, I2P and Freenet are the most commonly used ones. Many are used for hidden services access and some for proxy access to the Internet;
- There are **legitimate use-cases** for such network but also many **illegal or criminal usage**.

```

Collecting, processing and analysing content - web pages

- Building a search engine on the web is a challenging task because:
    - it has to crawl webpages,
    - it has to to make sense of **unstructured data**,
    - it has to **index** these data,
    - it has to provide a way to retrieve data and structure data (e.g. correlation).
- Doing so on Tor is even more challenging because:
    - services don't always want to be found,
    - parts of the dataset have to be discarded.
- in each case, it requires a lot of bandwidth, storage and computing power.

- Some data are structured and are easy to process:
  - ▶ metadata!
  - ▶ API responses.
- Some even provide cryptographic evidences:
  - ▶ authentication mechanisms between peers,
  - ▶ OpenGPG can leak a lot of metadata
    - key ids,
    - subject of email in thunderbird,
  - ▶ Bitcoin's Blockchain is public,
  - ▶ pivoting on these data with external sources yields interesting results.

AIL DESIGN OBJECTIVES

- Show how to use and extend an open source tool to monitor web pages, pastes, forums and hidden services
- Explain challenges and the design of the AIL open source framework
- Review different **collection mechanisms** and **sources**
- Learn how to create new modules
- Learn how to use, install and start AIL
- **Supporting investigation using the AIL framework** and including it in cyber threat intelligence lifecycle

AIL Framework

History:
- AIL initially started as an **internship project** (2014) to evaluate the feasibility to automate the analysis of (un)structured information to find leaks.
- In 2019, AIL framework is an **open source software** in Python. The software is actively used (and maintained) by CIRCL and many organisations.
- In 2020, AIL framework is now a complete project called **ail project**[2].

---

[2]https://github.com/ail-project/

Capabilities Overview

- **Check** if mail/password/other sensitive information (terms tracked) leaked
- **Detect** reconnaissance of your infrastructure
- **Search** for leaks inside an archive
- **Monitor** and crawl websites

- Proactive investigation: leaks detection
  - List of emails and passwords
  - Leaked database
  - AWS Keys
  - Credit-cards
  - PGP private keys
  - Certificate private keys
- Feed Passive DNS or any passive collection system
- CVE and PoC of vulnerabilities most used by attackers

- Website monitoring
  - ▶ monitor booters
  - ▶ Detect encoded exploits (WebShell, malware encoded in Base64...)
  - ▶ SQL injections
- Automatic and manual submission to threat sharing and incident response platforms
  - ▶ MISP
  - ▶ TheHive
- Term/Regex/Yara monitoring for local companies/government

- Example: `https://gist.github.com/`
  - ▶ Easily storing and sharing text online
  - ▶ Used by programmers and legitimate users
    $\rightarrow$ Source code & information about configurations

- Example: `https://gist.github.com/`
    - ▶ Easily storing and sharing text online
    - ▶ Used by programmers and legitimate users
        - → Source code & information about configurations
- Abused by attackers to store:
    - ▶ List of vulnerable/compromised sites
    - ▶ Software vulnerabilities (e.g. exploits)
    - ▶ Database dumps
        - → User data
        - → Credentials
        - → Credit card details
    - ▶ More and more …

- Economical interests (e.g. Adversaries promoting services)
- Ransom model (e.g. To publicly pressure the victims)
- Political motives (e.g. Adversaries showing off)
- Collaboration (e.g. Criminals need to collaborate)
- Operational infrastructure (e.g. malware exfiltrating information on a pastie website)
- Mistakes and errors

Yes!
and we have to deal with this as a CSIRT.

- **Contacting companies or organisations** who did specific accidental leaks
- **Discussing with media** about specific case of leaks and how to make it more practical/factual for everyone
- Evaluating the economical market for cyber criminals (e.g. DDoS booters[3] or reselling personal information - reality versus media coverage)
- Analysing collateral effects of malware, software vulnerabilities or exfiltration

  $\rightarrow$ And it's important to detect them automatically.

---

- Monitored paste sites: 27
  - ▶ *gist.github.com*
  - ▶ *ideone.com*
  - ▶ ...

	2016	2017	08.2018
Collected pastes	18,565,124	19,145,300	11,591,987
Incidents	244	266	208

Table: Pastes collected and incident[4] raised by CIRCL

---

[4]`http://www.circl.lu/pub/tr-46`

Current capabilities

- Extending AIL to add a new **analysis module** can be done in 50 lines of Python
- The framework **supports multi-processors/cores by default**. Any analysis module can be started multiple times to support faster processing during peak times or bulk import
- **Multiple** concurrent **data input**
- Tor Crawler (handle cookies authentication)

AIL Framework: Current features

- Extracting **credit cards numbers, credentials, phone numbers, ...**
- Extracting and validating potential **hostnames**
- Keeps track of **duplicates**
- Submission to threat sharing and incident response platform (**MISP** and **TheHive**)
- **Full-text indexer** to index unstructured information
- **Tagging** for classification and searches
- Terms, sets, regex and YARA **tracking and occurences**
- Archives, files and raw **submission** from the UI
- PGP, Cryptocurrency, Decoded (Base64, ...) and username Correlation
- And many more

- Search and monitor specific keywords/patterns
  - ▶ Automatic Tagging
  - ▶ Email Notifications
- Track Term
  - ▶ ddos
- Track Set
  - ▶ booter,ddos,stresser;2
- Track Regex
  - ▶ circl\.lu

CRAWLER

- Crawlers are used to navigate on regular website as well as .onion addresses (via automatic extraction of urls or manual submission)
- Splash ("scriptable" browser) is rending the pages (including javascript) and produce screenshots (HAR archive too)
How a domain is crawled by default

1. Fetch the first url
2. Render javascript (webkit browser)
3. Extract all urls
4. Filter url: keep all url of this domain
5. crawl next url (max depth = 1)

MISP

- **Tagging** is a simple way to attach a classification to an event or anattribute.
- **Classification must be globally used to be efficient.**
- Provide a set of already defined classifications modeling estimative language
- Taxonomies are implemented in a simple JSON format [5].
- Can be easily cherry-picked or extended

---

[5]`https://github.com/MISP/misp-taxonomies`

- **infoleak**: Information classified as being potential leak.
- **estimative-language**: Describe quality and credibility of underlying sources, data, and methodologies.
- **admiralty-scale**: Rank the reliability of a source and the credibility of an information
- **fpf**[6]: Evaluate the degree of identifiability of personal data and the types of pseudonymous data, de-identified data and anonymous data.

---

[6]Future of Privacy Forum

- **tor**: Describe Tor network infrastructure.
- **dark-web**: Criminal motivation on the dark web.
- **copine-scale**[7]: Categorise the severity of images of child sex abuse.

[7]Combating Paedophile Information Networks in Europe

Goal: submission to threat sharing and incident response platforms.

1. Use infoleak taxonomy[8]
2. Add your own tags
3. Export AIL objects to MISP core format
4. Download it or Create a MISP Event[9]

API

AIL exposes a ReST API which can be used to interact with the back-end[10].

```
curl https://127.0.0.1:7000/api/v1/get/item/default
        --header "Authorization: iHc1_ChZxj1aXmiFiF1m
        -H "Content-Type: application/json"
        --data @input.json -X POST
```

- AIL API is currently covering 60% of the functionality of back-end.

---

[10]https://github.com/ail-project/ail-framework/blob/master/doc/README.md

Setting up the framework

Setting up AIL-Framework from source

```
1 git clone
     https://github.com/ail-project/ail-framework.git
2 cd AIL-framework
3 ./installing_deps.sh
```

FEEDING THE FRAMEWORK

There are different way to feed AIL with data:

1. Setup *pystemon* and use the custom feeder
   - ▶ *pystemon* will collect items for you
2. Use the new JSON Feeder (twitter)
3. Feed your own data using the API or the `import_dir.py` script
4. Feed your own file/text using the UI (`Submit section`)

Submitting Pastes ...

100 %

Files Submitted 1/1

Submitted pastes

/home/ail/git/AIL-framework/PASTES/submitted/2018/06/29/02071570-b464-4bbb-be59-37c58c9b8925.gz

Submitted Pastes

Success ✔
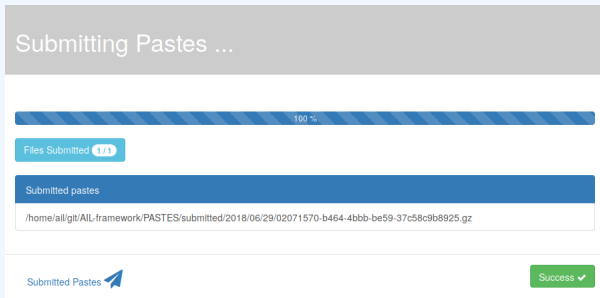

api/v1/import/item

```
1  {
2      "type": "text",
3      "tags": [
4          "infoleak:analyst-detection=\"private-key\""
5      ],
6      "text": "text to import"
7  }
```

/!\ requirements:

- Each file to be fed must be of a reasonable size:
  - ▶ $\sim$ 3 Mb / file is already large
  - ▶ This is because some modules are doing regex matching
  - ▶ If you want to feed a large file, better split it in multiple ones

1. Check your local configuration `configs/core.cfg`
   - In the file `configs/core.cfg`,
   - Add `127.0.0.1:5556` in `ZMQ_Global`
   - (should already be set by default)
2. Launch `import_dir.py` with de directory you want to import
   - `import_dir.py -d dir_path`
